

April End to End Project —> AI base

Tools

1. Linux
2. Shell
3. Git
4. Docker
5. K8s
 1. Helm
6. ANsible
7. Terraform
8. Jenkins
9. ArgoCD
10. Monitoring
 1. Promethues
 2. Grafana
 3. Alert manager
 4. Node exporter
11. AWS Cloud
12. GitHub Action

4 months

Build Application —> Deploy —> CI and CD end to end

AWS —> 10 +

Cloud —> AWS

Azure —> Call Interview

3hrs —> complete

Azure

Build application AI models —> Deploying —> k8s based

AI 1st + Tools part —> DevOps pipeline —>

AKS and EKS —> are same —> K8s —> yml

POA

1. Write building the AI model —> Docker hub or

FE —> Customer login will prompt —> GPT

BE —> AI Models —> API —> ChatGPT

DB —> RDS to response

Complete notes

1. Create new project directory in local under ID

2. Sub directory

1. FE

2. BE

3. Runner

3. Glthub repository

4. Azure login

5. VM for runner

6.

AI —> Mark Down file

Human —> Lecture and new study —> note book —> Revise

AI —> work —> end to end —> report and study —> md file —>

AI pro

Day 1 Home

1. Clone and fix the issue

2. Azure account

1. VMS

1. Vnet

2. Subnet

2. AKS

3. ACS

Day 2

April End to End Project —> AI base

Day2 —>

Creating Master Node as runner —>

AWS Server

1. Ec2
 1. Configuration
 1. AMI
 2. Key pair
 3. Security Group
 4. VPC
 5. Instance type

Runner —>

1. Manually Create the Server
 1. VM
 1. VNet
 2. Security Group
 3. Key pair
 4. Instance type
 - 2.
2. Terraform code Trigger creation

Private network —> SSH from laptop

Bastion host will act as public IP address —> Laptop —> SSH —>

Website

AWS CLI —> access and secret key

Azure login —> browser —> Login access —> token —> login

Azure cli to connect with azure resource??

Automation —> terraform or cli

POA —>

For Master node

1. Git clone the main branch
2. `git@github.com:devopsdecode/ai-model-gateway-devops-platform.git`
3. Install azure cli in your laptop
4. Azure account with login chrome
5. `az login`
6. Subscription select
7. Cd to runner as below
8. runner-node-master-node/fresh-master-node/
9. terraform init
10. `cd /Users/rajnadar/Desktop/April-End-End-Project/runner-node-master-node/terraform/fresh-master-node`
11. `export TF_VAR_ssh_public_key="$(cat ~/.ssh/id_ed25519.pub)"`
12. `terraform init`
13. `terraform plan`
14. `terraform apply -auto-approve`
15. Server

Github runner

1. SSH to server
2. Setting
3. Action
4. Runner
5. New self-hosted runner
6. Linux
7. Follow all the steps
8. `nohup ./run.sh &`

Day3
